

# Paratherm-OR®

## Heat Transfer Fluid

### Sludge Resistant, Non-Fouling, Non-Toxic

ENGINEERING BULLETIN OR 613

#### Longer life heat transfer fluid for portable temperature control units

The Paratherm OR® heat transfer fluid is formulated to provide extended protection against sludging in portable electric heaters up to 500°F/260°C.

#### Applications include:

- Plastics injection molding and profile extrusion
- Die casting die temperature control
- Solvent recovery

#### Extend time between fluid replacement

When hot heat transfer fluids are exposed to air in a reservoir, the molecules form acids. These acids then react to form sludge that can plug lines and coat reservoirs. Paratherm OR contains an additive package that prevents these acids from becoming carbon so the fluid stays solids-free longer. This significantly extends the interval between fluid replacements improving productivity and reducing waste.

#### Cost Effective

Like automobile oil changes, carbon/sludge formation in electric units can be controlled by periodic replacement of the heat transfer fluid. However, there is a cost for purchasing fluid and for disposal as well as for equipment down time. And if a machine has to run beyond its scheduled changeout date, it could require significant maintenance. So using a cheap fluid may not always be the most cost effective.

#### Fluid storage

Drums should be stored inside to prevent water from getting into the heat transfer fluid. If sealed drums must be left outdoors, they should be stored on their sides. While unopened totes are weatherproof, they should not be stacked if left outdoors. If the fluid is to be stored outside below its minimum pumpable temperature, the containers should be moved indoors to warm up before charging the fluid into the system.

#### Typical Properties\*

Product Name	Paratherm OR Heat Transfer Fluid
Chemical Name	Hydrotreated White Mineral Oil
Appearance	Water White Liquid
Odor	Odorless
Maximum Recommended Film Temperature	550°F/288°C
Maximum Recommended Operating Temperature-Fired Heaters	Not Recommended
Maximum Recommended Operating Temperature-All Others	500°F/260°C
Minimum Operating Temperature 20 cPs (20 mPa-s)	128°F/53°C
Minimum Start-up Temperature 300 cPs (300 mPa-s)	40°F/4°C
Viscosity cSt:	
40°C (104°F)	40.2
100°C (212°F)	6.09
260°C (500°F)	0.88
Density at 60°F/15.5°C lb/gal (kg/m <sup>3</sup> )	7.5 (881)
Flash Point Pensky-Martens Closed Cup (D93)	330°F/166°C
Vapor Pressure @ maximum operating temperature psia (kPa)	2 (14)
Average Volume Expansion, %/100°F (100°C)	4.8 (8.6)
Average Molecular Weight	360
Heat of Combustion (approximate) BTU/lb (kJ/kg)	20,000 (46,300)
Heat of Vaporization (approximate) BTU/lb (kJ/kg)	93 (215)
Pour Point D97 °F(°C)	<-25°F/-32°C

\* These are typical laboratory values, and are not guaranteed for all samples

#### Replacing existing fluid

In many cases, changing fluid involves a straightforward drain and fill. There are very few fluids that are so incompatible that 10-15% residue will affect the new Paratherm. If you have any questions, contact us.

#### Charging new systems

Unless required for product-quality reasons, new systems do not need to be cleaned before Paratherm is charged. The amount of chemical coatings, oils, and other manufacturing residues are usually not enough to affect the fluid life. All that is necessary is to install a Y-strainer with a minimum 60-mesh screen upstream of the pump to catch any metal or welding residue. The screen can be removed once the system has been cycled twice through its operating temperature.

#### Fluid analysis

The fluid in new systems should be tested within the 9 to 12 months of start-up. New fluid in existing systems should be tested within the first month of operation to establish a baseline for future testing.
